

Temporary Protection and Technology Adoption

Evidence from the Napoleonic Blockade

Réka Juhász

Columbia - Princeton IES

March 18, 2016

Research Question

- 1 Can infant industry protection work?
 - ▶ Long tradition in the history of economic thought
 - ▶ Mechanisms formalized by economic theory
 - ▶ Empirical challenges make identification difficult
- 2 This paper: Natural experiment which replicates infant industry protection

Natural experiment from 19th century France

- 1 Context: Development of mechanized cotton spinning across French Empire during and after the Napoleonic Wars (1803-1815)
- 2 Empirical challenges
 - ▶ Protection usually implemented at the country-wide level
 - ★ Here: Exogenous, within country variation in trade protection
 - ▶ Protection usually implemented by policy-maker
 - ★ Here: Temporary protection driven by changes in trade costs
- 3 This paper: Costs of trading with Britain increase temporarily and differentially across French regions

Identifying infant industry mechanism in two steps

- 1 **Short run:** Did regions which became better protected from trade increase capacity in new technology more?
- 2 **Long-run:** Did the effects persist after pre-blockade variation in trade protection was restored?

Exogenous variation from Napoleonic Blockade

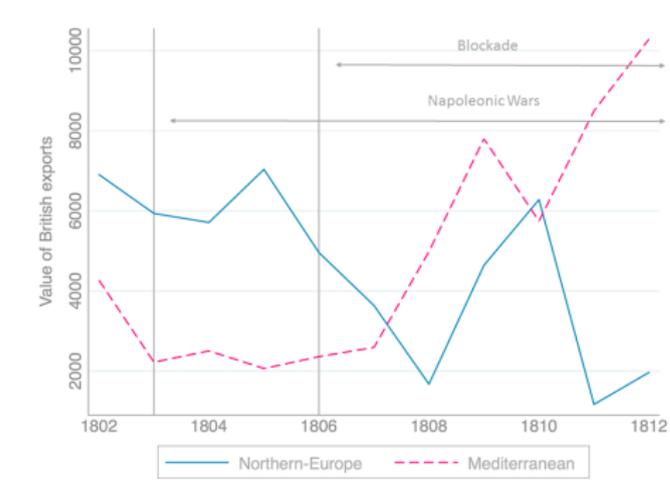

The Napoleonic Blockade against Britain

- Implemented as a “self-blockade”
- Displacement of trade routes increased trade costs with Britain differentially across France

Blockade successful in North, not in South

► cexp

Trade did not stop; direction changed

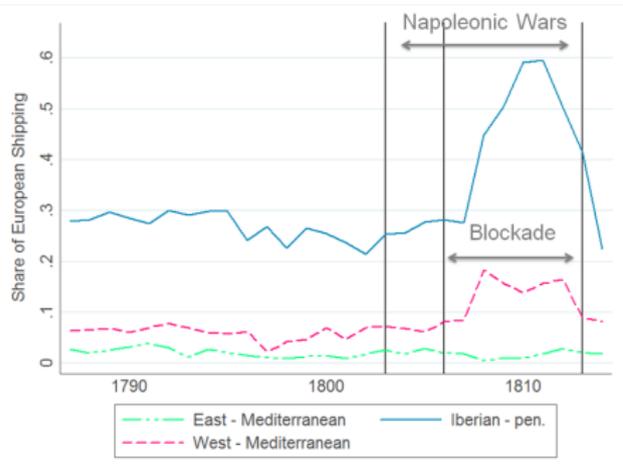

Exports of British merchandise and other produce

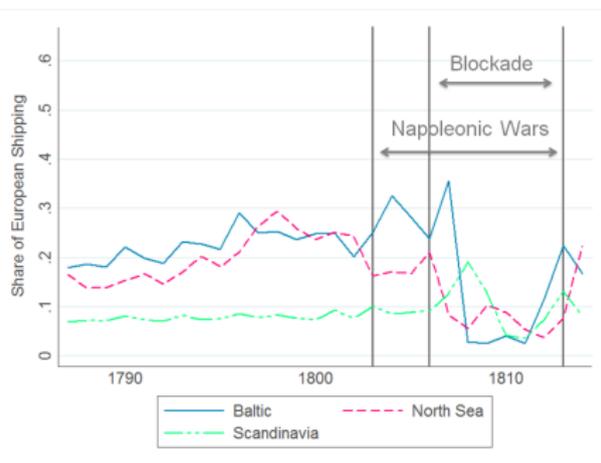

Significant change in routes within regions

▶ france

▶ rhine

Southern Europe

Northern Europe

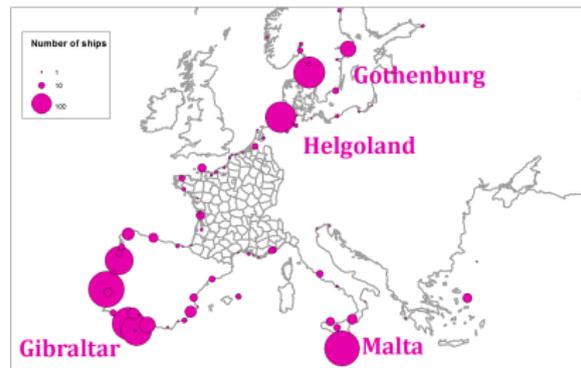

Share of shipping with Britain

Variation in blockade at the port level

Smuggling via stable ports outside the French Empire accessible to Great Britain

Port usage, "Before blockade"

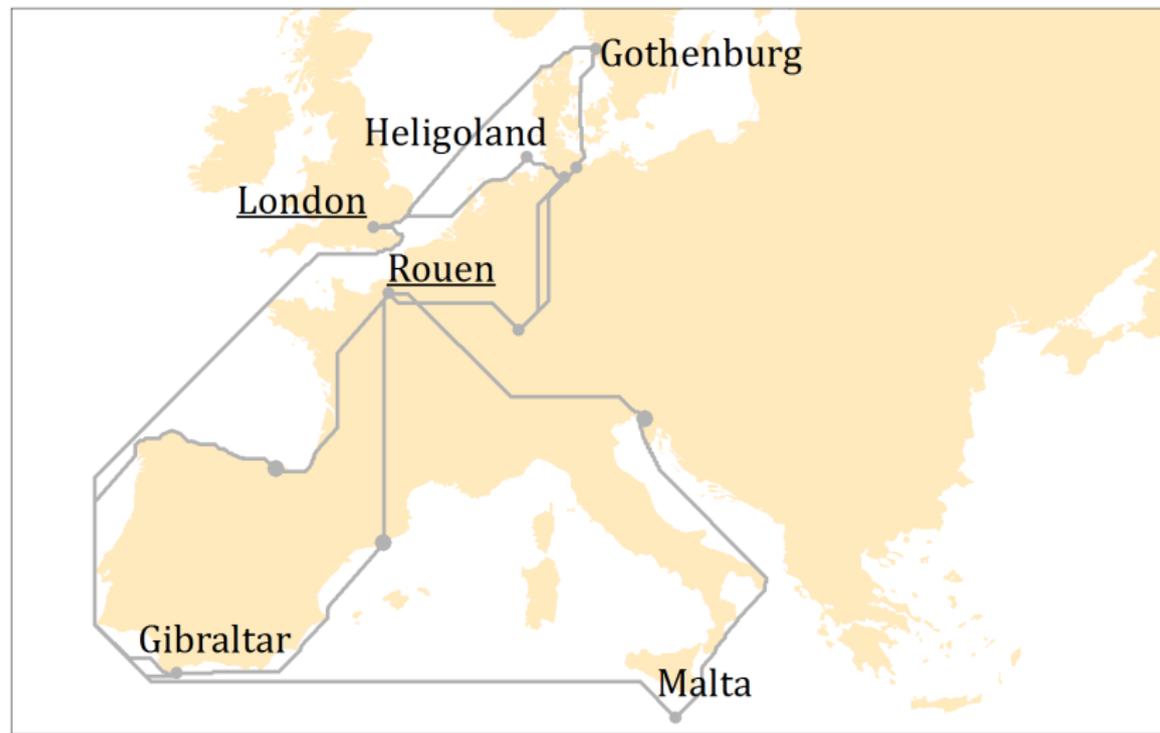

Port usage, "Blockade"

Unconstrained shortest route

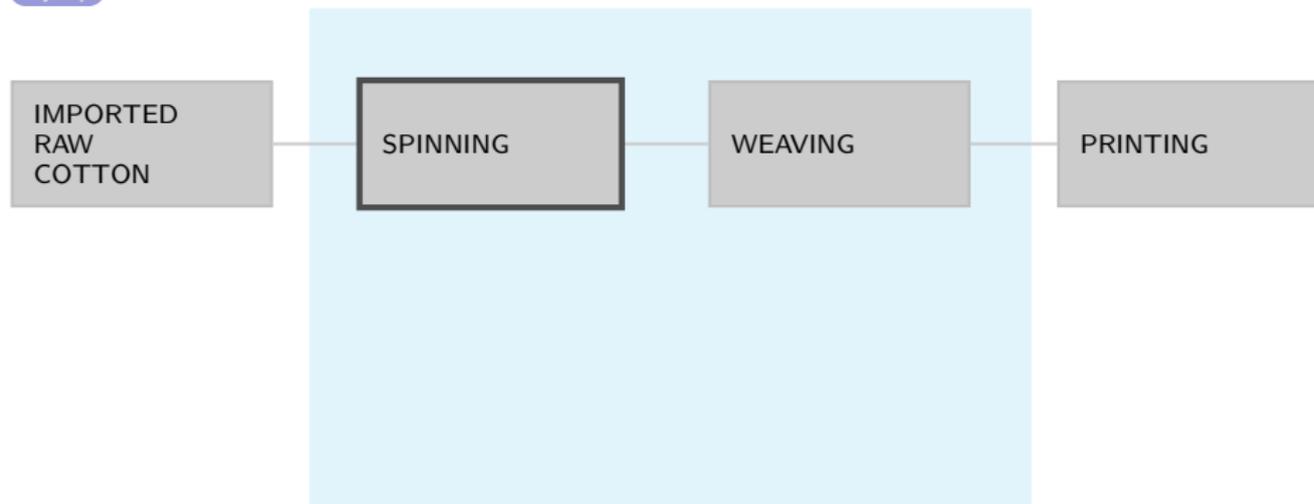

Smuggling routes

Historical context

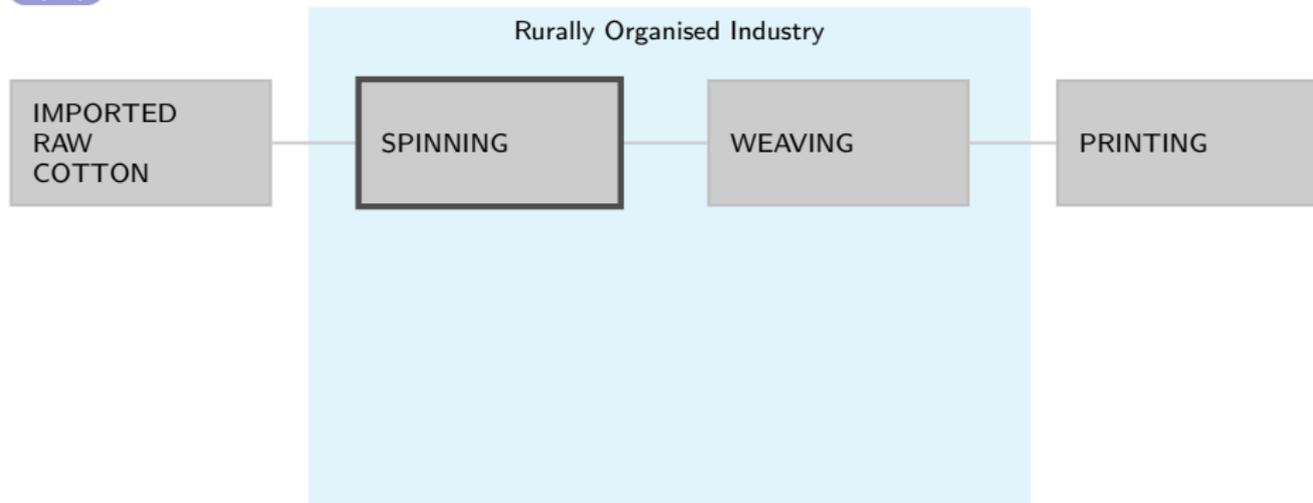

The cotton industry in France

▶ jenny

The cotton industry in France

▶ jenny

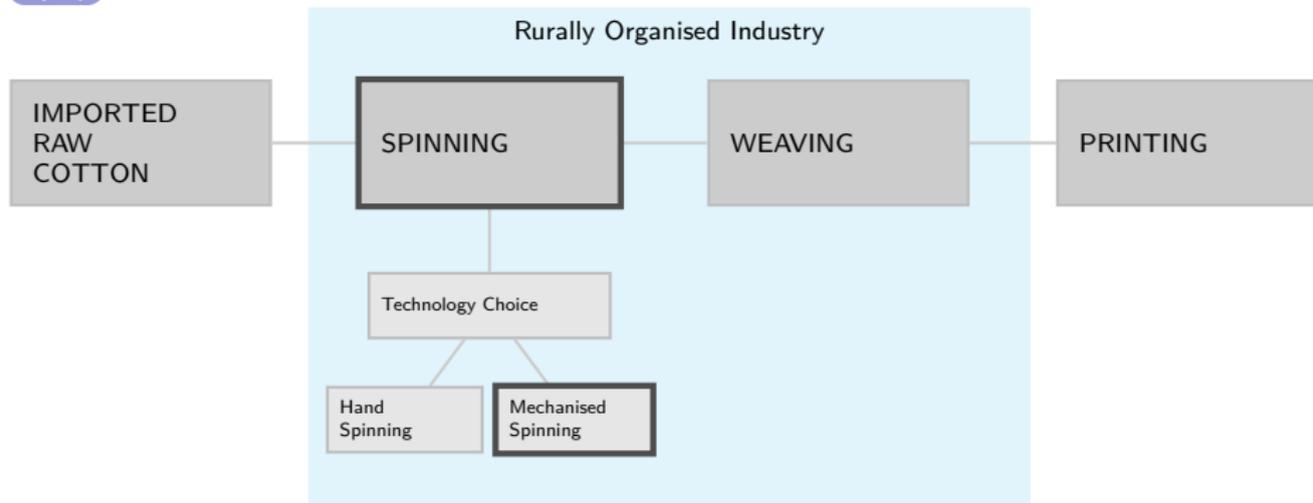

Imported from:

- Levant
- Brazil
- Colonies
- US

Import Competition: Great Britain

The cotton industry in France

▶ jenny

Imported from:

- Levant
- Brazil
- Colonies
- US

Import Competition: Great Britain

Invention and diffusion in Britain vs. non-adoption in France

- Similar conditions prior to mechanization
- Rapid diffusion of technology in Britain 
 - ▶ Machine was cheap and depreciated fast
 - ▶ First industry to adopt modern, factory-based production methods
- Surprisingly slow adoption in France (1790: 800 vs 19,000 jennies)
- 1800: France not competitive in cottons 

Empirical strategy - Short run

Empirical Strategy - Short run

▶ dept

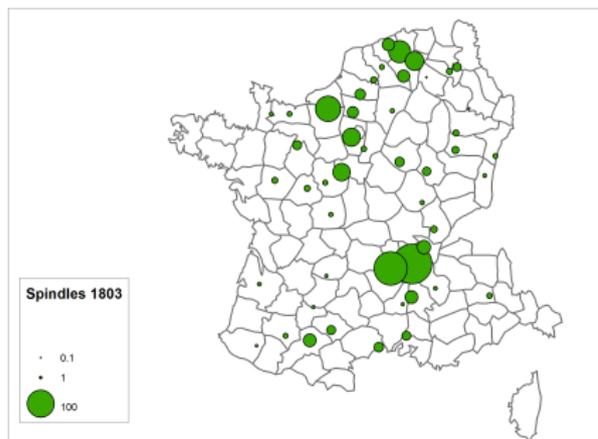

- Question: Did protection render cotton spinning profitable in the short-run?
- Blockade source of exogenous variation in trade protection
- Baseline specification:

$$S_{it} = \alpha_i + \delta_t + \gamma \ln D_{it} + \epsilon_{it} \quad (1)$$

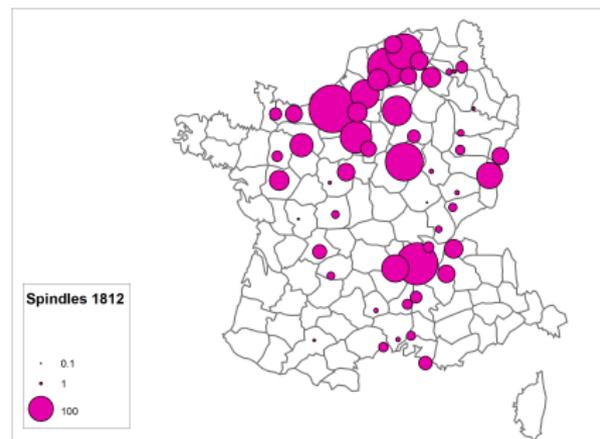

- Identifying assumption: No contemporaneous shock correlated with trade cost shock to imported yarn

Variation used: 1803-12

- 1803-12: spinning capacity quadrupled
- Development highly uneven

Long-term effects

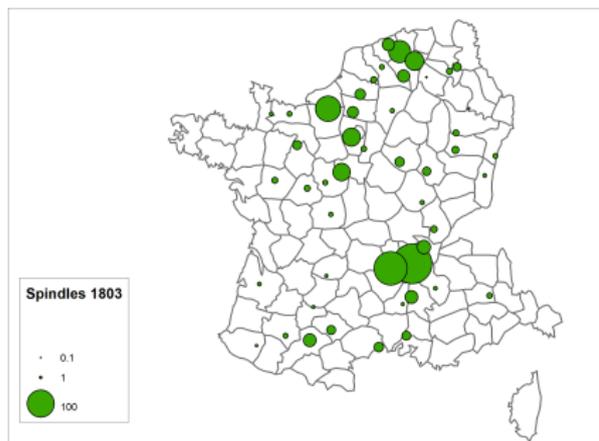

Empirical strategy - Long run within country

- Question: Did short-run protection affect the long-term profitability of production?
- Outcomes of interest: persistence, productivity, aggregate regional effects
- Trade cost shock solves the endogeneity of location of cotton spinning capacity

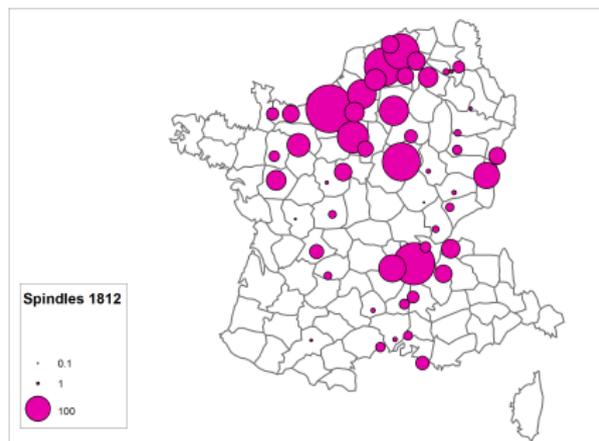

$$Y_{i(j)t} = \alpha + \beta S_{i,1812} + \gamma' X + \eta_{i(j)t} \quad (2)$$

- Identifying assumption: Trade cost shock uncorrelated with other determinants of location of industry and firm productivity

Reminder: Location of cotton industry 1803-12

1803

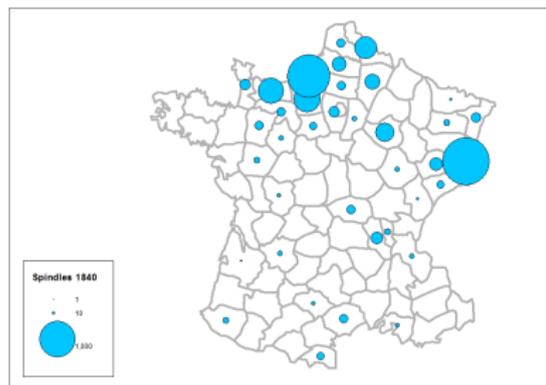

1812

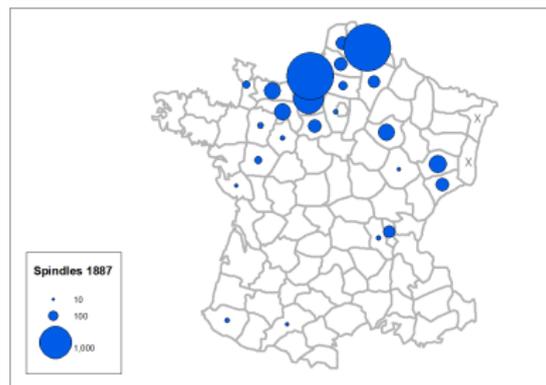

Spindles per capita

Persistence in location of cotton industry 1840-87

Between 1803-1887 spinning capacity increased fivefold

1840

1887

Note: The label "X" denotes the two departments, Haut-Rhin and Bas-Rhin, ceded to Germany 1871 - 1918. Data for 1887 is not available for these regions.

Mills test: Increasing exports

▶ crosscountry

▶ timeseries

▶ nx

French exports of cotton, millions of 1820 francs

French exports of cotton as a share of British exports

Contribution

A historical episode in which effects of trade protection consistent with infant industry

- Exogenous within country variation in temporary trade protection
- Separate economic from political mechanism
- Differential shock to import-competition on output side, but not imported inputs

Conclusion

- 1 Mechanised spinning became competitive in parts of France because of increased trade protection
- 2 External validity?
 - ▶ General setting
 - ★ Low-skilled labour intensive textile manufacturing
 - ★ Shift in organisation of labour
 - ▶ Initial differences between Britain and France small
